Venn Diagrams and the Addition Rule

Name _____

Probability is how likely something is, from 0 (impossible) to 1 (certain). When every outcome is equally likely:

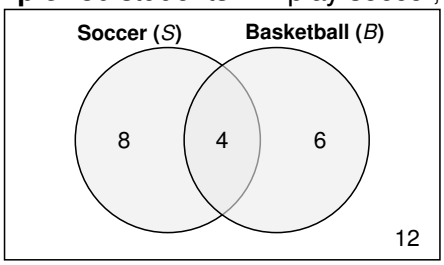
$$P(A) = \frac{\text{number of ways } A \text{ can happen}}{\text{total number of outcomes}}$$

$P(A)$ is read "the probability of A." **Complement:** $P(\text{not } A) = 1 - P(A)$. (Some books write $P(A^C)$.)

Symbols for "or" and "and"

Symbol	Read it as	Meaning
$A \cup B$	"A union B" or "A or B"	A happens, or B happens, or both
$A \cap B$	"A intersect B" or "A and B"	A and B both happen (the overlap)

Example: 30 students. 12 play soccer, 10 play basketball, 4 play both.



If we add $12+10$, the 4 students who play both are counted **twice**. Subtract them once.

$$P(S \cup B) = \frac{12}{30} + \frac{10}{30} - \frac{4}{30} = \frac{18}{30} = 0.6$$

The addition rule: $P(A \cup B) = P(A) + P(B) - P(A \cap B)$

Mutually exclusive events cannot both happen, so $P(A \cap B) = 0$. Then $P(A \cup B) = P(A) + P(B)$.

Example: Roll a number cube (1 to 6). Rolling a 1 and rolling a 2 are mutually exclusive.
$P(1 \cup 2) = \frac{1}{6} + \frac{1}{6} = \frac{2}{6} = \frac{1}{3}$

A deck of cards has 52 cards: 4 suits (hearts, diamonds, clubs, spades), 13 cards in each suit (A, 2 to 10, J, Q, K).

Work with a partner. Compare answers when you finish each problem.

1. Roll a number cube (1 to 6). Find each probability.

   (a) $P(\text{even})$

   (b) $P(\text{not } 6)$

   (c) $P(\text{greater than } 4)$

2. In a class of 40 students, 18 take Spanish (S), 15 take art (A), and 6 take both.

   (a) Fill in the Venn diagram.

   (b) Find $P(S \cup A)$.

   (c) Find $P(S \cap A)$.

   (d) Find the probability that a student takes neither.

3. $P(A) = 0.5$, $P(B) = 0.4$, and $P(A \cap B) = 0.2$. Find $P(A \cup B)$.

4. Draw one card from a deck. Are the events mutually exclusive? Find the probability.

   (a) a heart or a spade

   (b) a heart or a king

5. Pick one student from this table at random.

	Bus	**Car**	**Walk**	**Total**
9th grade	18	12	10	40
10th grade	14	20	6	40
Total	32	32	16	80

   (a) $P(\text{9th grade} \cap \text{car})$

   (b) $P(\text{10th grade} \cup \text{walk})$

6. A student says, "$P(A) = 0.6$ and $P(B) = 0.5$, so $P(A \cup B) = 1.1$." What did the student do wrong?
